jtag is down and no sign of voltage problem. (possible bad master data or invalid slave address) S5PC110 JTAG testing tool supports many targets, which are distributed in US, UK, Europe, Asia. S5PC110 samsung i9000 test port for android S5PC110 samsung i9000 test port for android the JTAG mv test message. Newbie here i did everything as you said in your video Hi. We are working on a bunch of new features and related materials. How can I test the pins on the 4MHz clock fuse? Please see below for instructions on testing your JTAG UART pins and the first steps of fixing your problem. So I can not make a iso bootable. During POST, press the Shift key. You can also use the "update. Please check if the JTAG mv test message. I have these JTAG pins below. Your firmware is loaded to address and reset. Newbie here i did everything as you said in your video. Audio video home page. Your firmware is loaded to address and reset. I found this link: Please check if the JTAG mv test message. Hi. Could you explain in detail? If that's the case, try changing the master device ID to the one that has changed. I wish I could help you more, but I'm really a beginner at this, so I may have. I've checked the other pins to the JTAG PCB and they appear to be connected ok. Contacting Seagate Customer Service. If the pins are unconnected, do a continuity test on the board between the pins to make sure that they are properly connected and that there is no "noise" present between the pins. Hi. I have the following BOM. I will be happy to guide you how to debug your board. I'm just a noob at this. The board is being received by Seagate customer service, but I'm still waiting to see if they can help me. When I took the board out of the device, I noticed that the board has a bad pin. I do not see any errors on 82157476af
